Butterfly.—The male on the upper side is pale lilac-blue, with the outer borders and tie ends of the veins narrowly dusky. The female is brownish-gray on the upper side, with the wings at their base glossed with blue. In both sexes there is a rather conspicuous black spot on the margin of the hind wings between the first and second median nervules. The under side is accurately depicted in our plate, to which the student may refer. Expanse, i.oo inch.

Early Stages.—Unknown.

The species occurs in Texas, Arizona, and Mexico.

(33)Lycsena hanno, Stoll, Plate XXXII, Fig. 3, *$, under side* (The Florida Blue).

Butterfly.—Larger than the preceding species, on the upper side resembling *L. isola;* but the blue of the male is not lilac, but bright purplish, and the female is much darker. On the under side a striking distinction is found in the absence on the fore wing of the postmedian band of large dark spots so conspicuous in *L isola.* Expanse, .85 inch.

Early Stages.—We have no information as to these.

The insect occurs in Florida and throughout the Antilles and Central America.

(34)Lycsena isophthalma, Herrich-Schaffer, Plate XXXII, Fig. 4, *$* (The Dwarf Blue).

Butterfly.—Light brown on the upper side in both sexes, with the outer margin of the hind wings set with a row of dark spots, which on the under side are defined by circlets of metallic scales. The under side is pale brown, profusely marked by light spots and short bands. Expanse, .75 inch.

*Early Stages.—*Up to this time we have learned very little concerning them.

The species occurs in the Gulf States and the Antilles.

(35) Lycsena exilis, Boisduval, Plate XXXII, Fig. 5, *$* (The Pygmy Blue).

*Butterfly.—*On the upper side this, which is the smallest of North American butterflies, very closely resembles

the foregoing species, but may be instantly distinguished by the white spot at the inner angle of the fore wing and the white fringes of the same wing near the apex. The hind wings on the under side are set with a marginal series of dark- spots ringed about with metallic scales. Expanse, .65 inch.
